

Mermaid diagrams

The new @Mermaid passthrough macro routes ““mermaid“fenced code blocks through the SVG back-end’ sforeignObject’, where the browser’s mermaid.js engine engraves them at view-time. Three of the most common shapes are below; the PDF route renders each as a placeholder.

1. Top-down flowchart

A four-node flowchart with a diamond decision branching to two outcomes:

[Mermaid diagram omitted in non-SVG back-end]

2. Sequence diagram

Three actors exchanging three round-trip messages – the canonical "client / server / database" walk-through:

[Mermaid diagram omitted in non-SVG back-end]

3. Class diagram

A two-class relationship with one method on each side:

[Mermaid diagram omitted in non-SVG back-end]

In HTML mode (the default `./mdlout.py examples/mermaid.md`), each fence engraves into vector geometry alongside the surrounding prose. In PDF mode (`-format=pdf`), each fence renders as [Mermaid diagram omitted in non-SVG back-end] – pre-render with the `mmdc CLI` and `![] (diagram.svg)` if you need the diagrams in print.
