

Lists and tables

A bullet list of typesetting systems:

- TeX, the venerable original
- Lout, Kingston's stream-based alternative
- Groff, the troff descendant powering Unix man pages
- SILE, a modern Lua-driven engine

A numbered list of build steps:

1. Run the markdown parser to produce a block list.
2. Walk the blocks and emit Lout source.
3. Invoke the `lout` binary to render PostScript or SVG.
4. Wrap the result in HTML or convert to PDF.

A task list tracking the macros work:

- ☒ Text emission
- ☒ Page geometry
- ☐ Colour pipeline
- ☐ `@Math` / `@ABC` / `@SVG` passthrough macros

A definition list of Lout symbols:

Galleout's fundamental unit of vertical flow is a column of text that gets

attached into a target.

@**Display** centred, indented block $\hat{a}$,~ the workhorse for figures and equations.

@**PP**Start a new paragraph with the configured paragraph gap.

A pipe table of common Lout document types (note the alignment markers in the separator row:
left-aligned, centred, right-aligned):

Type	Package		Headings	
doc	doc	indent ctr	@Display styled	indent right
report	report	indent ctr	@Section	indent right
book	book	indent ctr	@Chapter	indent right
slides	slides	indent ctr	@Overhead	indent right

And a grid table for cell wrapping:

Feature	Status	Owner
Text	Working	core
Fonts	Working	core
Colour	In progress	macros
SVG raw	In progress	macros
